,, object (frame 1) ,, object (frame 2)

! Can frame 2

Diagram illustrating the calculation of the motion cost (Euclidean distance) between the predicted and actual positions.

Frame 1: The mean shift operation results in a predicted position (x_1, y_1) .

Frame 2: The object detector (OD) identifies the actual position (x'_1, y'_1) .

The motion cost is calculated as:

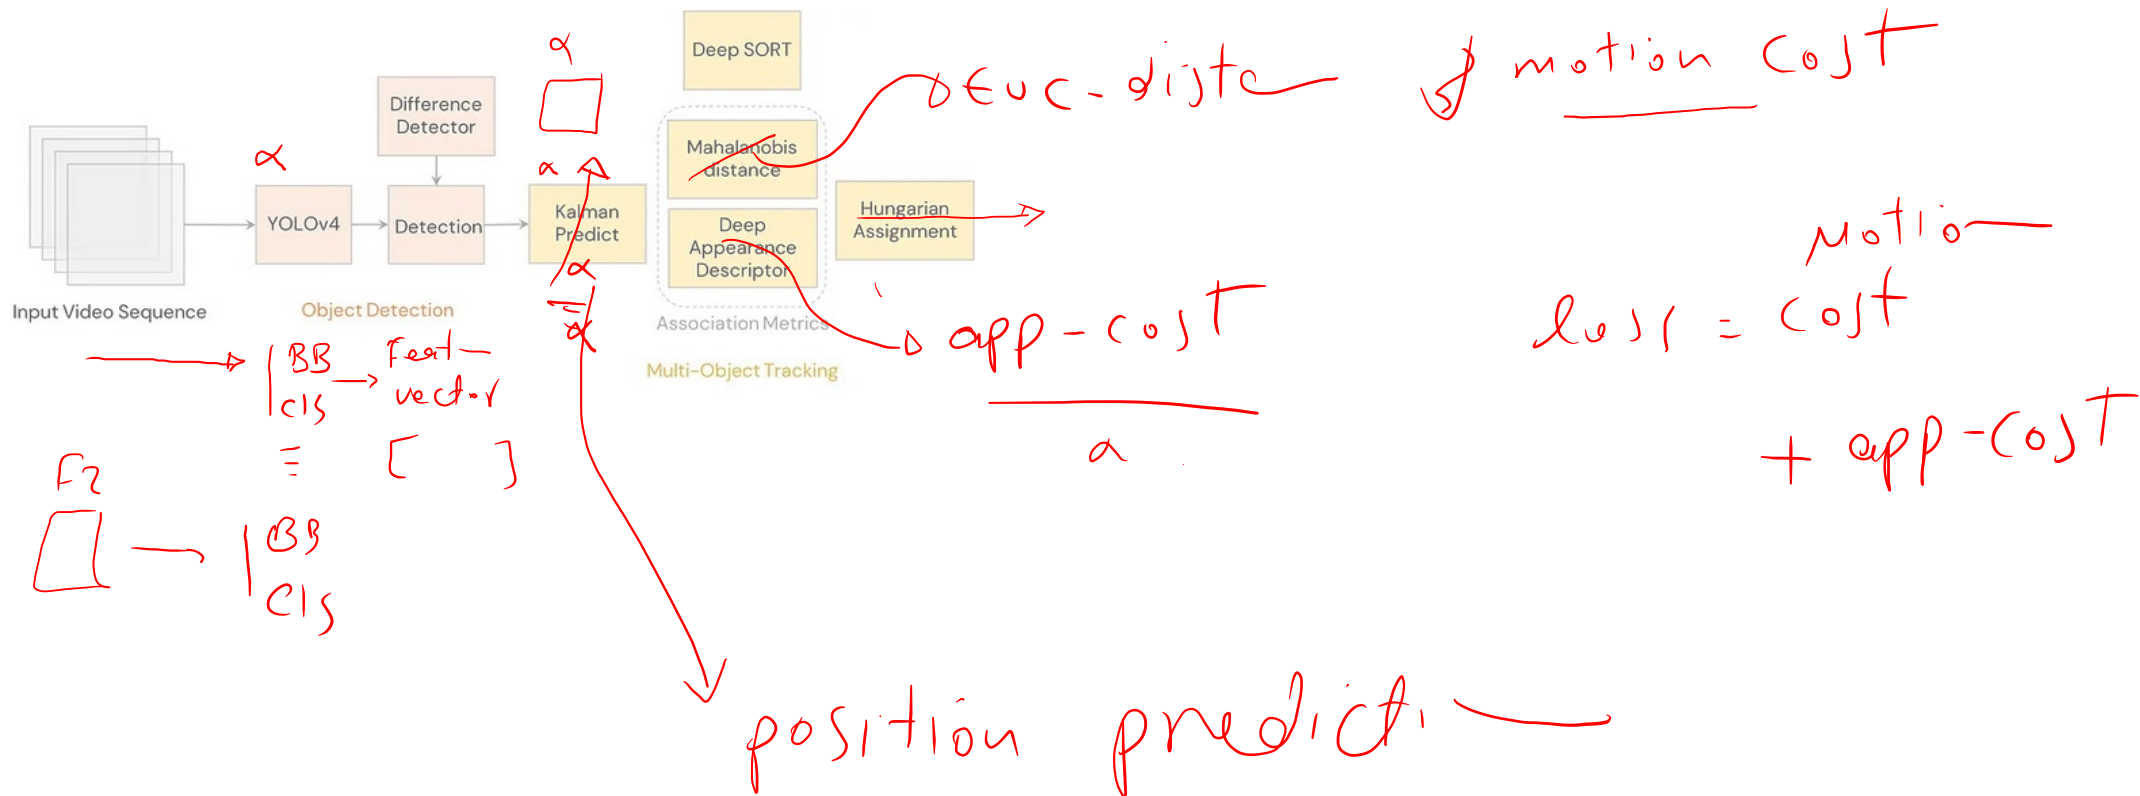

$$\sqrt{(x_1 - x'_1)^2 + (y_1 - y'_1)^2}$$

motion cost ← تھمے رکھنا BB ہر فریم object میں گھرا رہنا ہاگدا

Appearance cost ← تھمے رکھنا object میں صفراء ہونے، رہنا سڑا
